PLANNER DASHBOARD · V0.2

Reason about the grid *from one prompt.*

An AI co-pilot for the people who plan Canada's electricity grid.

01 · THE PROBLEM

Canada's grid is being asked to do more than ever.

— **Electric cars and heat pumps** are changing how much power we use, faster than utilities can plan for.

— **Extreme weather** like deep-freezes and heatwaves puts the grid — and people — at risk.

— **Big grid decisions** still take months, cost millions, and rely on outside consultants.

— **Today's tools are stuck** in spreadsheets — planners juggle weather, maps, and grid data by hand.

02 · THE SOLUTION

One question. Five tools. The AI picks the right one.

- **Just type what you need —** no settings, no forms, no jargon.
- **An AI assistant** picks the right kind of analysis for your question.
- **Watch it think live —** every step, every data source, in real time.
- **Powered by Claude AI** with custom tools we built for energy data.
- **Easy to grow —** new analysis types can be added without rebuilding the app.

03 · CAPABILITIES

Five tools, one assistant.

Datacenter Siting
Finds the best place in Canada to build a new AI data center, balancing carbon intensity, latency, and cost.

Expansion Planner
Figures out how to grow an existing data center site.

Winter Peak Stress Tester
Simulates a deep cold snap to see how heat pumps, EVs, and electric heaters push the grid.

Electrification Readiness
Tells you which neighborhoods are ready for more electric vehicles and heat pumps, and which need help first.

Grid Investment Optimizer
Takes a fixed upgrade budget and finds the smartest way to spend it for the most protection against future climate disasters.

04 · CHALLENGE FIT

Built for the challenge.

Smart Grid Resilience & Preparing for Electrification

RESILIENCE

When the grid is stressed.

— **Winter Peak Stress Tester** — see how a deep-freeze hits your grid

— **Investment Optimizer** — spend upgrade money where it protects most

ELECTRIFICATION

When demand is changing.

— **Electrification Readiness** — score neighborhoods for EV and heat pump growth

— **Datacenter Siting + Expansion** — place big new power users wisely

Canadian-first — uses live data from Ontario (IESO), Alberta (AESO), Quebec, and Natural Resources Canada

05 · MARKET OPPORTUNITY

$1 trillion+ in Canadian grid investment by 2050.

BY 2050

$1T+

Cost of doubling Canada's electricity grid to power EVs, heat pumps, and net-zero goals.

Source: NRCan, Powering Canada Strong (national electricity strategy, May 2026)

— **Whole market:** software for planning Canada's electricity grid.

— **Realistic share:** 60+ Canadian utilities, plus federal and provincial planners and big cities.

— **First customers:** mid-size local utilities facing the EV/heat pump wave first.

— **Adjacent market:** global grid planning software, $2.04B in 2025 growing to $4.12B by 2030 (15.2% CAGR).

Sources: NRCan Powering Canada Strong, 2026 (grid investment); The Business Research Company, Grid Planning Software Global Market Report, 2026 (adjacent market).

06 · REVENUE MODEL

Three ways customers pay.

Pricing benchmarks based on comparable utility-planning tools (PowerWorld, Energy Exemplar AURORA, Siemens PSS/E). Final pricing TBD after pilots.

Monthly subscriptions	Utility planners — about $1,200 per seat per month	RECURRING
Enterprise contracts	Large utilities and federal agencies — $250K to $2M per year	RECURRING
One-off studies	Consultants and developers — $25K to $100K per report	TRANSACTIONAL
Premium data add-ons	Specialized datasets and live grid feeds	ADD-ON
Setup & training	Hands-on help getting big customers up and running	SERVICES

07 · ROADMAP

From hackathon to platform.

NOW

Q2 '26

First version

5 analysis types

First customer testing

Web dashboard

NEXT

Q3 '26

Live grid data

Real-time feeds

Multiple companies at once

Full activity logs

LATER

Q4 '26

Plug-in mode

Connects to grid mapping and control software

Customer-branded versions

2027

2027

Self-driving

AI-improved forecasting

Auto-generated what-if scenarios

08 · WHAT'S NEXT

Next 90 days.

- **Pilot with 1–2 Canadian utilities** to prove the workflow on real grid data.
- **Build a Remote Community tool** to help Canada's ~280 off-grid towns switch from diesel to renewables.
- **Live grid stress dashboard** showing real-time conditions and what people can do to help.
- **Open the platform** so outside teams can build their own analysis tools on Skorpio.
- **Grow the team** — add 1 backend engineer, 1 data engineer, 1 customer success lead.

09 · TECH STACK

Built modern, ready to grow, Canadian data first.

WHAT YOU SEE

A clean web dashboard (React, TypeScript) built for grid planners

BEHIND THE SCENES

A Python web service streams answers live as the AI reasons

THE BRAIN

Claude AI (Sonnet, Opus, Haiku) with custom energy tools

THE DATA

Live grid feeds: IESO, AESO, Hydro-Québec

Weather, prices, carbon

HOW IT RUNS

Docker containers, Snowflake for analytics, automated testing

Thanks — questions?
